WIPO STUDIES ON THE ECONOMIC CONTRIBUTION OF THE COPYRIGHT INDUSTRIES

1. BACKGROUND

Since 2002 the World Intellectual Property Organization (WIPO) supports research on assessing the economic contribution of industries which are dependent on copyright and related rights protection – “the copyright industries” (CRI) . In 2003 WIPO published common guidelines on carrying out such research throughout the world¹. This methodology outlines four groups of copyright industries, identified on the basis of their level of dependence on copyright material. It establishes a set of major indicators – contribution to GDP, employment and foreign trade, and lays out research standards and approaches. The WIPO guidelines were developed on the basis of best international practices reviewed by an expert group of renowned economists. The guidelines have been implemented in over 40 countries around the world and their improvement continues with the experience gained.

The present analysis is built on data from just under 40 national studies which have been finalized until December 2012². The analysis seeks to present the available data in a unified manner in order to facilitate further research and investigation in this area. The data matrix that has been created enables constant update of the overview of results from country studies and the presentation of the variables surveyed. Currently the data base includes over 60 variables, including data from other relevant sources that enhance reporting and analysis on the subject matter. The analysis contained in this document presents an overview of the performance of the copyright industries in selected countries in terms of macroeconomic indicators. It compares this performance with other socio-economic indicators and analyses the structure of this economic contribution, outlining trends and patterns in a comparative perspective. The direct data analysis is followed by a data relationship analysis and a more detailed specific industry analysis.

2. DIRECT DATA ANALYSIS: COUNTRY COMPARISONS

The direct data analysis is based on two major indicators employed to measure performance of the copyright industries: Contribution to GDP (%) and Share of Employment (%). On the basis of the two a country positioning scheme is established.

2.1. Copyright Industries Contribution to GDP and Employment

Chart 1: Overall Contribution of Copyright Industries to GDP and Employment³

The overall performance of the copyright industries in the countries surveyed indicates the existence of a sizeable sector, which in most countries was found to be beyond the level of expectations. Copyright has often been perceived predominantly as a legal category and has not been analyzed as a factor of social and economic importance. The overview suggests that copyright industries have a significant overall economic contribution.

2.1.1. Contribution to GDP

The contribution to GDP varies significantly across countries from over 10% in the USA to under 2% for Brunei. With the average 5.26 %, three quarters of the countries have a contribution between 4% and 6.5%. Countries that have experienced rapid economic growth typically have above average share of GDP attributed to copyright industries.

Chart 2: Contribution of Copyright Industries to GDP⁴

Source: WIPO

2.1.2. Contribution to National Employment

The contribution of copyright industries to national employment is slightly higher than the share of GDP and stands at an average of 5.49%. Nearly three quarters of the countries fall in the range between 4% and 7% contribution to national employment. Mexico and the Philippines have by far the highest share of their labor force in the copyright Industries. Most countries with above average share of creative industries⁵ in GDP also exhibit above average share of employment.

Chart 3: Contribution of Copyright Industries to National Employment

Source: WIPO

2.2. Labor Productivity

On the basis of the GDP and employment contributions a Labor Productivity Index can be calculated. Labor Productivity is defined as the ability to produce a given contribution to the national GDP by employing a given share of labor resources. It is calculated as the proportion between the share of GDP, and share of national employment attributed to copyright industries. With 100 being the base, an index above indicates that higher share of creative industries GDP output is achieved with lower share of labor input.

Chart 4: Labor Productivity Index for Copyright Industries

Source: WIPO

Countries that have the highest calculated Labor Productivity do not necessarily have a high contribution to GDP which is a deviation from the expected pattern. Countries' high productivity index is a result of increased monetary value per unit of labor. In some cases the values of the index can be explained with a relatively low share of formal employment in the creative sector.

2.3. Country positioning

The country positioning is analyzed through the four quadrant paradigm. Based on their position along the two indicators, share in GDP and share in employment, countries can be attributed a position on the four quadrants chart. This analysis is of practical use when following a country's development over time with the goal of monitoring performance tendencies.

The national studies suggest that some of the factors that define the position of countries on the plot could be summarized as follows:

- Positioning of copyright industries in domestic and global markets;
- Monetary value attached to creative products
- National policies supporting this sector of the economy
- Cultural characteristics and national traditions⁶

Chart 5: Country Positioning based on GDP and Employment

Source: WIPO

The majority of the countries are clustered either in the upper right quadrant (Q1; high share of GDP, high employment) or in the lower left quadrant (Q3; low share of GDP, low share in employment). Keeping in mind that this clustering is relative to the average contribution of CRI in the sample, it could reveal potentially important patterns in the development of CRI over time.

3. DATA RELATIONSHIP ANALYSIS

The data relationship analysis seeks to establish statistically significant relationships between the contribution of copyright industries to GDP and other available indicators and indexes of socio-economic performance.

3.1. Gross Domestic Product per Capita

There is a positive relation between the contribution of copyright industries to GDP and the GDP per Capita⁷. However, GDP per Capita is a broad indicator and it is not the only factor that affects the economic contribution of copyright industries, as considerable differences exist between countries within the same GDP per capita brackets.

Chart 6: Relationship between Contribution of Copyright Industries to GDP and GDP per Capita (2011)

Source: The World Bank Development Indicators

3.2. International Property Rights Index

The International Property Rights Index (IPRI) is an international comparative study that measures the significance of both physical and intellectual property rights and their protection for economic well-being. The Index focuses on three areas:

- Legal and Political Environment
- Physical Property Rights
- Intellectual Property Rights

The study prepared by the Property Rights Alliance⁸ analyzes data for 129 countries around the globe, representing ninety-seven percent of world GDP.

Chart 7: Relationship between Contribution of Copyright Industries to GDP and the IPR Index

Source: WIPO and Property Rights Alliance

The analysis suggests a strong and positive relationship that exists between the contribution of copyright industries to GDP and the IPR Index. Countries with the highest share of copyright industries to GDP typically have well functioning property rights legislation.

3.3. Index of Economic Freedom

The *Index of Economic Freedom*⁹ ranks countries on a 1-100 scale according to 10 categories that evaluate economic openness, competitiveness and the rule of law, such as business freedom, trade freedom, fiscal freedom, property rights, freedom from corruption, etc. Countries that score well demonstrate a commitment to individual empowerment, non-discrimination and the promotion of competition. Their economies tend to perform better, and their populations tend to enjoy more prosperity, better health care and more positive measures on a variety of quality-of-life indices. Economies rated “free” (scoring 80-100) or “mostly free” (scoring 70-79.9) in the 2011 *Index* enjoy incomes that are more than three times the average levels in the rest of the world.

Chart 9: Relationship between Contribution of Copyright Industries to GDP and the Freedom from Corruption Index

Source: The Heritage Foundation and Transparency International

Contribution of Copyright industries to GDP exhibits strong and positive relationship with the Freedom from Corruption indicator. Greater freedom from corruption is associated with greater transparency and predictability in the institutional context, which is important for investment in creative industries.

3.5. Global Competitiveness Index

The World Economic Forum’s Competitiveness Report and report series, as the world’s most comprehensive and respected assessment of countries’ competitiveness mirrors the business operating environment and competitiveness of over 140 economies worldwide. The report series identify advantages as well as impediments to national growth thereby offering a unique benchmarking tool to the public and private sectors as well as academia and civil society. In addition to statistical data, the index also features data from the Executive Opinion Survey carried out by the World Economic Forum with over 13,000 business leaders representing the 142 countries in the report.

Chart 10: Relationship between Contribution of Copyright Industries to GDP and the Global Competitiveness Index

Source: The World Economic Forum (WEF)

The analysis suggests that there is a strong and positive relationship between the contribution of copyright industries to GDP and the Global Competitiveness Index. There is high level of clustering of the sample at the high end of the competitiveness and the GDP contribution scale, and at medium-low end of the scale. The clustering at the high end of the scales suggests that countries with high level of competitiveness have a strong presence of CRI in the economy as CRI are symbols of advanced knowledge, ideas and innovation.

3.6. Global Innovation Index

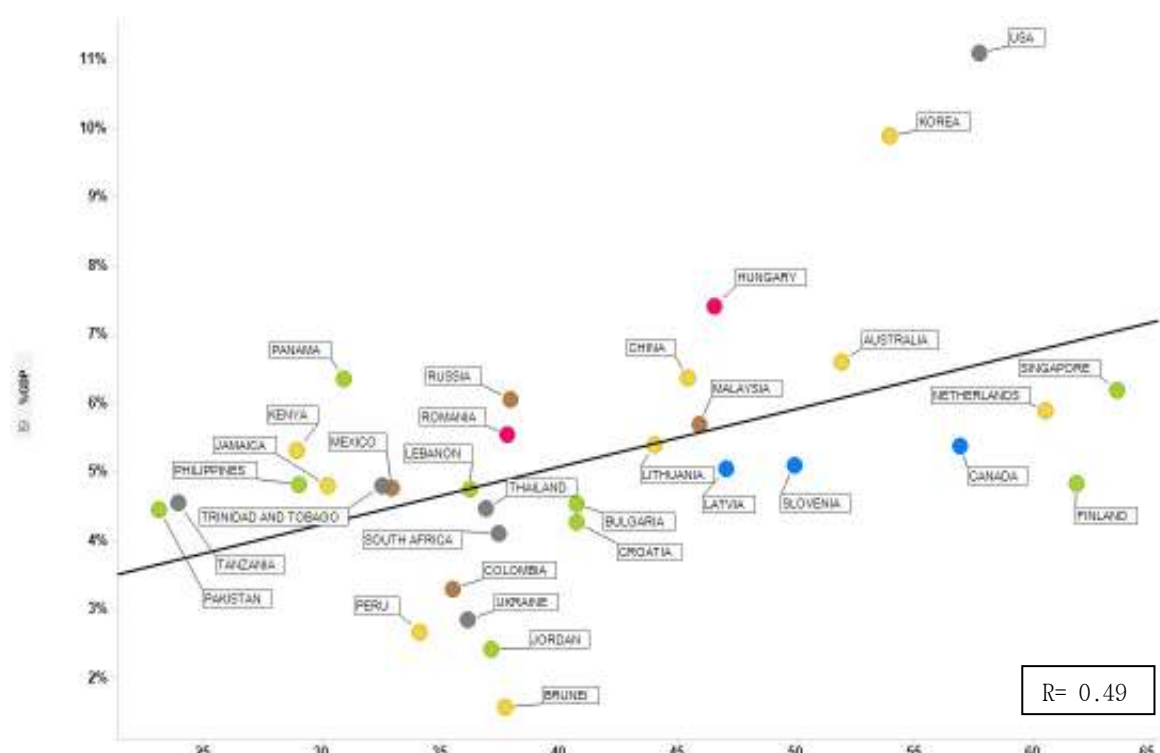

INSEAD, supported by WIPO and other partners produce in partnership the INSEAD Global Innovation Index (GII), recognizing the key role of innovation as a driver of economic growth and prosperity.

The GII acknowledges the need for a broad horizontal vision of innovation that is applicable to both developed and emerging economies, with the inclusion of indicators that go beyond the traditional measures of innovation, to also include:

- Institutions
- Human capital and research
- Infrastructure
- Market and business sophistication

The GII is evolving into a valuable benchmarking tool to facilitate public-private dialogue, whereby policymakers, business leaders and other stakeholders can evaluate progress on a continuous basis.

Chart 11: Relationship between Contribution of Copyright Industries to GDP and the Global Innovation Index 2012

Source: INSEAD eLab

This indicator has a positive and highly significant relation with performance of the creative industries. This relationship implies that innovation and creativity are inherently and positively connected. The innovation leaders such as developed economies and some of the rapidly growing developing countries (Korea, Singapore, China, Malaysia), but also countries in transition such as Hungary and Slovenia, are a testimony to this close relationship.

Chart 12: Summary of correlations

CORRELATIONS OF %GDP WITH:	CORRELATION COEFFICIENT
Global Innovation Index	0.49
Global Competitiveness Index	0.44
International Property Rights Index (IPR)	0.39
Freedom from Corruption	0.39
Index of Economic Freedom	0.31
GDP per Capita	0.31

Source: WIPO

The summary of the correlation coefficients suggests a definitive positive relationship between the GDP contribution of the creative sector and innovation, competitiveness, international property rights and freedom from corruption.

4. BREAKDOWN OF THE CONTRIBUTION BY GROUP AND INDUSTRY

The WIPO methodology distinguishes between 4 different groups of copyright industries in function of the level of dependence on copyright material – core, interdependent, partial and non-dedicated support industries¹¹. This section will review in some detail the contribution of the core copyright industries, while the remaining three groups of industries representing the non-core copyright industries are dealt with in the subsequent section of the report.

More than half of the total contribution of the copyright industries to GDP and employment comes from the core copyright industries.

Chart 13: Contribution of Copyright Industries to GDP and Employment by Groups of Industries.

Source: WIPO

4.1. Contribution of the core copyright industries to GDP

The pie chart reveals the average break-down of industry formation of the core sector. With 39%, Press and Literature is by far the biggest contributor to generating added value. The other driver industries – Software and Databases, Radio & TV, Music & Theatre, Advertising, Motion picture and video exhibit together over 50% of the share, with Software and Databases alone standing for almost half of that contribution.

Chart 14: Contribution of Core Copyright Industries to GDP by Industry¹²

Source: WIPO

Chart 15: Contribution of Core Copyright Industries to GDP by Country

Source: WIPO

4.2. National diversity

The economic contribution of Copyright industries is not evenly distributed between different industries, and neither between countries. Although Press and Literature appears to have the highest share for most of the counties, it is not the case for all countries. Chart 15 presents a visualization of the creative diversity across countries represented by the different weight of the creative sector in each nation.

Chart 16: Contribution of Core Copyright Industries by Industry in Specific Countries

Source: WIPO

4.3. Average Share of the Core Industries by Employment

Just under half of the labor force in the Core copyright industries is employed in Press and Literature. The top 5 industries in terms of share of employment account for over 80% of the total employment. Software and Databases and Radio & TV are the most labor intensive sectors, providing higher contribution to GDP compared to the labor input in them.

Chart 17: Contribution of the Core Copyright Industries to Employment by Industry

Source: WIPO

Chart 18: Contribution of Core Copyright Industries to Employment by Country

Source: WIPO

4.4. Comparison between the Contributions of the Copyright Industries with Other Key Industries in Selected Countries

Chart 19: Contribution of Copyright Industries and Other Sectors of the Economy in Selected Countries

Source: WIPO

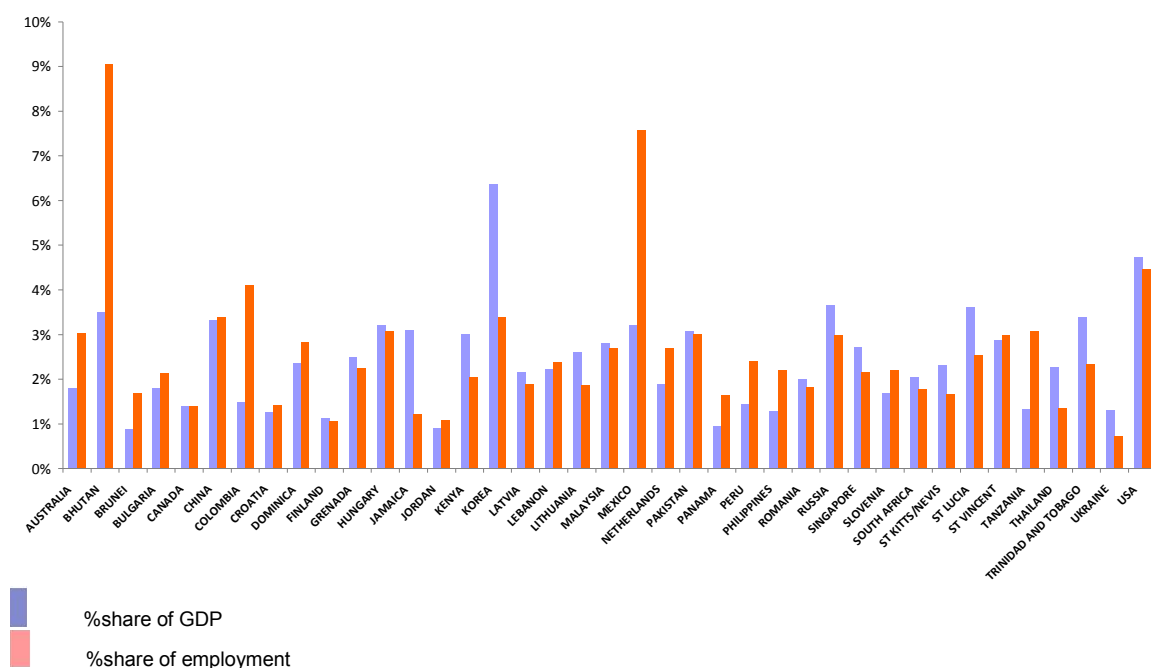

Chart 19 suggests that the copyright industries are a sector which is gaining weight in comparison with other sectors. In many countries it is more substantive in size than traditional economic sectors such as agriculture and fully comparable with tourism, hotels and restaurants.

5. CONTRIBUTION OF THE NON-CORE COPYRIGHT INDUSTRIES

The non-core copyright industries are the interdependent, partial and non-dedicated support industries. The analysis suggests a great degree of variability among countries in terms of the overall contribution of the non-core copyright industries to GDP and employment.

5.1. Overall Contribution of the non-core group

Chart 20: Major Performance Indicators for the Economic Contribution of the Non-Core Copyright Industries

Source: WIPO

The positioning of countries presented on Chart 20 and Chart 21 indicates a somewhat different pattern than the contribution of the core sector to GDP.

Chart 21: Contribution of Non-Core Copyright Industries to GDP

Source: WIPO

Chart 22: Contribution of Non-core Copyright Industries to Employment

Source: WIPO

5.2. Contribution of interdependent industries

5.2.1. Contribution of interdependent industries to GDP

Chart 23 reveals the average break-down of industry formation of the interdependent copyright industries. With 35% of the share *Production of Computers and Equipment* is the leader in terms of generated value added among the group of interdependent industries. The top three industries account for over 80% of the share of the subsector

Chart 23: Contribution of Interdependent Industries to GDP

Source: WIPO

5.2.2. Contribution of interdependent industries to employment

Chart 24: Contribution of Interdependent Industries to Employment

Source: WIPO

The pie chart reveals the average break-down of industry share of employment of the interdependent non core industries. It indicates that the % employed in the manufacturing of TV sets and Radio is significantly lower than the % employed in the manufacturing of musical instruments. Computer manufacturing remains an area of major importance in terms of job creation in the interdependent group.

5.3. Contribution of the partial copyright industries

The partial copyright industries represent activities where copyright stands only for a portion of the produced value added and employment, weighted with an assigned copyright factor.

5.3.1. Contribution of partial copyright industries to GDP

Chart 25: Contribution of Partial Copyright Industries to GDP

Source: WIPO

The chart shows that architecture by far provides the highest share of GDP in the group of partial industries.

5.3.2. Contribution of partial industries to employment

Chart 26: Contribution of Partial Industries to Employment

Source: WIPO

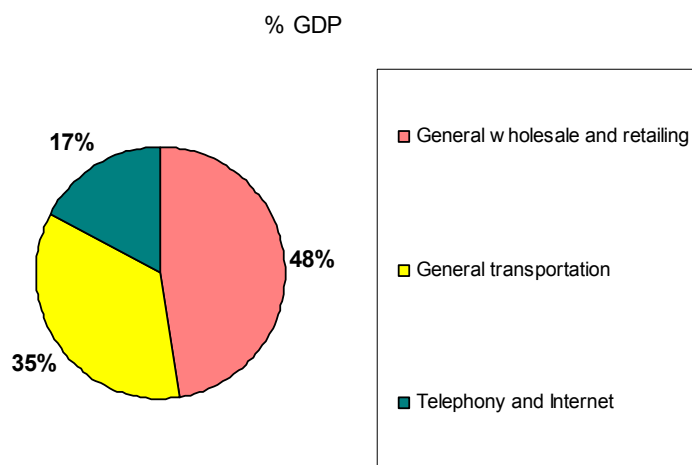

While Architecture still holds the leading position in terms of % employment, it has given way to an increased share of employment in Furniture, Apparel and Toys and Games manufacturing.

5.4. Contribution of non-dedicated support industries

Non-dedicated industries measure secondary impacts and spillover effect of the copyright industries on the economy. The contribution of these industries is weighted with a copyright factor. This information provides insights on the effect of copyright on other spheres of the economy.

5.4.1. Contribution of non-dedicated industries to GDP

Chart 27: Contribution of Non-Dedicated Copyright Industries to GDP

Source: WIPO

General Wholesale and Retail assures half of the contribution to GDP of this group of copyright industries.

5.4.2. Contribution of non-dedicated support industries to Employment

Chart 28: Contribution of Non-dedicated Copyright Industries to Employment

Source: WIPO

General wholesale accounts for an even higher share of Employment with 56%, followed by a large share (36%) of employment in General Transportation. However, studies containing time series suggest a growing share of internet related services.

6. COPYRIGHT INDUSTRIES IN THE DEVELOPMENT CONTEXT

Developed Countries contribution to GDP and Employment is considerably higher than the contribution in Developing and Transition economies respectively.

Chart 29: Contribution to GDP and Employment by Groups of Countries in the Development Context

Source: WIPO

Within the Core industries only, Developed countries have a GDP share 75% higher than Transition, and two times higher than Developing countries. Within the Non-Core Industries however, the Developing countries have the highest average share of GDP, as well as the highest share of employment.

Chart 30: Contribution to GDP and Employment by Industry Groups in the Developmental Context

Source: WIPO

The Chart suggests that the developed economies produce more value and jobs in their core copyright industries. For the developing world non-core sectors are of higher significance in terms of employment generation and value creation. This conclusion points to the importance of including non-core sectors in any analysis of the copyright contribution, incl. non-direct impacts, which could more accurately capture the economic linkages and spillover effects of copyright in developing economies.

7.6. Country profiles

Selected information from the national studies is provided in a country sheet format. The available fact sheets are presented in Annex II.

8. LIMITATIONS OF THE USED METHODOLOGY

The WIPO methodology is only one of the available tools for assessing the economic importance of the creative sector. While this method is gaining acceptance and credibility with each new study which is undertaken, it has to be borne in mind that it has some important limitations, which need to be considered in the interpretation of the results of the studies.

The assessment of the size of the copyright industries is based on the method of measuring the value added, created in the copyright-industries as a percentage of the GDP. The value added approach is a universally adopted industry-centered approach, based on a standardized measurement technique, which allows the identification of the contribution by industry, as recorded in National accounts. The value added method reduces the chances of double-counting; it makes use of input-output tables and indicates important relationships in the economy.

This method has also a number of shortcomings related to its inability to differentiate between copyright-related and non copyright-related activities within a selected industry. It may inevitably also omit some elements, related to copyright in industries which are not included in the study. The method does not disclose which part of the value is added to the product while creating and producing it and which part is added in the modification, distribution or consumption phases of the value chain. This may limit a more in-depth analysis of the copyright industries.

The methodology is based on official data sources as it focuses on comparability between countries. In many cases, however, creative products are produced and distributed in the informal economy and may not be accounted for in national accounts statistics. Same applies for job generation, which may not be fully reflected in census statistics if creative activities fall outside the scope of the adopted statistical survey methodology. This limitation generally reflects an understatement of the employment potential in the copyright industries.

When interpreting the results of the studies it should also be borne in mind that occasionally the figures may reflect statistical adaptations, for example more recent industrial classification systems may group differently economic activities. This may result in higher or lower shares of certain industries or industry groups which may not necessarily be linked to a better or worse performance of the industry, but simply reflect a change in the adopted model for statistical reporting.

Finally, the surveying of macroeconomic indicators is based on a number of assumptions, the most important of which is that copyright is enforced, i.e. that the economic activities that are measured are based on respect for copyright and related rights. This assumption is needed for the measurement purposes, however the results obtained through the study should not be interpreted as a direct indicator of the strength of copyright enforcement in each individual country.

9. THE WAY FORWARD

The results of the national surveys confirm the importance of copyright-based industries in overall economic performance. Creative industries are well connected with the rest of the economy and have an active presence in the economic cycle. In many countries, creative industries are playing a more important role than some traditional industries. Creative industries performance is enhanced when stimulated by governments (economic freedom), the legal system (well established property rights) and the businesses environment (competitiveness, innovation).

National studies confirm the applicability of the WIPO methodology in countries at various levels of development. Developed countries performance in terms of contribution to GDP is higher in core copyright industries, while the developing countries have higher contribution in the non-core industries. New studies that are being carried out across the world will enhance the analysis and the overview of the performance of the creative industries in the global economy.

More broadly representative sample to include a greater share of emerging and developed economies will strengthen the robustness of the analysis. The next steps could involve time series analysis, cluster/regional analysis, deeper examination of the relationships through a statistical model that would seek to disclose closer causal relationships between copyright industries performance measures and relevant explanatory variables.

The merit of further studies and deeper analysis of the copyright industries is in outlining the potential of copyright for development, the need of linking the implementation of a robust copyright regime to the achievement of development objectives. This can be achieved through streamlining and applying uniform approaches to future research. The WIPO model is a valuable tool in the context of such analysis.

January 2013

Annex 1: OVERALL CONTRIBUTION BY COUNTRY AND INDUSTRY GROUP

COUNTRY	YEAR OF PUBLICATION	% CONTRIBUTION OF COPYRIGHT-BASED INDUSTRIES TO GDP					% CONTRIBUTION OF COPYRIGHT-BASED INDUSTRIES TO EMPLOYMENT				
		Total Share	Core	Interdependent	Partial	Non-dedicated	Total Share	Core	Interdependent	Partial	Non-dedicated

¹ WIPO Guide on Surveying the Economic Contribution of the Copyright-Based Industries, WIPO Publication No 893 (E), ISBN 978-92-805-1225-7

² Results from published WIPO Studies are published in the series “National Studies on Assessing the Economic Contribution of the Copyright-Based Industries”: Volume 1- WIPO Publication No 624 (E), ISBN 92-805-1553-5; Volume 2 - WIPO Publication No 1009 (E), ISBN 978-805-1732-3; Volume 3 - WIPO Publication No 1017 (E), ISBN 978-92-805-1908-2; Volume 4 - WIPO Publication No 1024 (E), ISBN 978-92-805-2022-4; Volume 5 -WIPO Publication No 1032 (E), ISBN 978-92-805-2156-6, Volume 6 – WIPO Publication No. 1036 (E). ISBN 978-92-805-2268-6 available also at http://www.wipo.int/ip_development/en/creative_industry/economic_contribution.html. The results from the OECS member states, Jordan, Tanzania and Lithuania are currently being finalized before publication.

³ Detailed statistics on the individual contribution of the copyright industries in each country is contained in Annex I to this document

⁴ The results based on the Study on Economic Contribution of Copyright-Based Industries in Trinidad and Tobago is pending for approval

⁵ The terms *creative industries* and *copyright industries* are used interchangeably throughout the document

⁶ Based on the narratives of the studies published in the Creative Industries series.

⁷ Statistical significance for all correlations is calculated at the 95% level. This indicates that obtaining the respective relationship by chance is less than 5%.

⁸ <http://www.internationalpropertyrightsindex.org/>

⁹ The index is prepared by the Heritage Foundation in cooperation with the Wall Street Journal, available at <http://www.heritage.org/index/default>

¹⁰ In scoring freedom from corruption, the Index converts the raw CPI data to a scale of 0 to 100 by multiplying the CPI score by 10.

¹¹ See WIPO Guide on Surveying the Economic Contribution of the Copyright-Based Industries, WIPO Publication No 893 (E), ISBN 978-92-805-1225-7

¹² All breakdowns of the contribution of the specific industries either to GDP or employment are calculated on the basis of the available statistics in the national reports. It has to be noted that some country reports do not exhibit the breakdown for various reasons; hence the contribution of specific industries to GDP and employment does not reflect their national specifics. Percentages for charts 13, 14, 17, 23, 24, 25, 26, 27, 28, 29 and 30 were calculated as an average of countries' creative industries share to either CDP or Employment
